

Trucker Path PM Take-Home

AI-Native Fleet Operations for Small Fleets

About Trucker Path

Trucker Path is North America's leading trucking intelligence platform, serving over 1 million truck drivers with tools for truck navigation, parking, fuel, and fleet management. We move the backbone of the American economy — and we're building the AI layer that makes it smarter.

The Problem

Small and mid-size trucking fleets (5–50 trucks) are the engine of American freight — but they're running on spreadsheets, phone calls, and gut instinct.

A typical fleet dispatcher today:

- Manually assigns loads to drivers without visibility into real-time position, HOS (Hours of Service) remaining, or fuel cost impact
- Has no reliable way to monitor loads in transit — breakdowns, delays, and route deviations go undetected until it's too late to intervene
- Has no systematic way to monitor driver safety or compliance — HOS violations, missed vehicle inspections, and fatigued driving go undetected until an incident or audit forces the issue
- Manually assembles billing packets for every load — chasing down BOLs, PODs, fuel receipts, and rate confirmations from drivers — before reconciling them into invoices, a process prone to errors, missed charges, and delayed cash flow
- Has no unified view of fleet cost per mile, driver performance, or route efficiency

Your Challenge

Design and build an AI-native fleet operations assistant that helps a small fleet dispatcher make smarter, faster decisions — reducing cost per mile and driver downtime.

Your solution should address at least two of the following problem areas:

Area	Example Pain Point
Smart Dispatch	A dispatcher has to call or text each driver to check their location and remaining HOS hours before assigning a load — with no system to compare options across the fleet, they often put the wrong driver on a load, creating costly deadhead miles and ripple effects across tomorrow's assignments.
Proactive Alerts	Loads in transit go dark — breakdowns, weather delays, and route deviations aren't detected until a customer calls asking where their freight is, and

	by then it's too late to reroute or relay.
Cost Intelligence	Fleet owners have no unified view of true cost per mile broken down by driver, route, or load — they can't tell whether rising costs are driven by excess deadhead, poor fuel routing, or forced HOS rest stops in expensive corridors.
Safety & Compliance	HOS violations, missed vehicle inspections, and fatigued driving patterns go undetected until a roadside audit or an accident forces the issue — there's no early warning system that flags risk before it becomes an incident.
Billing & Document Automation	After every load, the dispatcher manually chases drivers for BOLs, PODs, fuel receipts, and rate confirmations, then manually reconciles them into invoices — a process that delays cash flow by days and regularly results in missed charges or billing errors.

Deliverables

Deliverable	Details
Working Prototype	A live, interactive prototype that we can click through and use. The AI components should actually call an LLM — not be mocked behavior. You're encouraged to use AI coding tools (Cursor, Claude Code, v0, Lovable, etc.) — we want to see how you turn a product idea into a working product with AI in the loop. Tech stack is your call.
Product Deck	Walk us through why you made the choices you made, what you traded off, and how you'd measure success. Format and structure are up to you — we care about your thinking, not a template.
GTM Plan (optional)	If you have a point of view on target customer, pricing, or acquisition, share it.
